DETAILED ACTION

Continued Examination Under 37 CFR 1.114

1. A request for continued examination under 37 CFR 1.114, including the fee set forth in 37 CFR 1.17(e), was filed in this application after final rejection. Since this application is eligible for continued examination under 37 CFR 1.114, and the fee set forth in 37 CFR 1.17(e) has been timely paid, the finality of the previous Office action has been withdrawn pursuant to 37 CFR 1.114. Applicant's submission filed on September 22, 2006 has been entered.

Response to Arguments

2. Applicant's arguments with respect to claims 1-6 have been considered but are moot in view of the new ground(s) of rejection.

Claim Rejections - 35 USC § 102

3. The following is a quotation of the appropriate paragraphs of 35 U.S.C. 102 that form the basis for the rejections under this section made in this Office action:

A person shall be entitled to a patent unless –

(b) the invention was patented or described in a printed publication in this or a foreign country or in public use or on sale in this country, more than one year prior to the date of application for patent in the United States.

4. Claims 1, 3 and 5 are rejected under 35 U.S.C. 102(b) as being anticipate by Faroudja (US Patent No. 5,428,398).

In considering claim 1, Faroudja discloses all the claimed subject matter, note 1) the claimed an apparatus for providing a smooth interpolated video signal at any desired rate from a slower rate video signal (color television system of Figs. 1A-1B) means for up-sampling the slower rate video signal to the desired rate is met by the

Art Unit: 2622

motion-adaptive line doubler 106 which doubles any input formats (Figs. 1-2, col. 5, lines 25-65), and 2) the claimed means for adaptively filtering the up-sampled slower rate video signal using a human visual model to produce the smooth interpolated video signal is met by the non-linear enhancer 110 which substantial suppression of all visually annoying artifacts, achieves a viewer-perceived picture quality (human visual model) that is substantially better than would result if image enhancement and sharpening were not provided (Figs. 1A-1B, col. 3, lines 34-64 and col. 5, line 66 to col. 6, line 62).

Claim 3 is rejected for the same reason as discussed in claim 1.

Claim 5 is rejected for the same reason as discussed in claim 1.

Claim Rejections - 35 USC § 103

5. The following is a quotation of 35 U.S.C. 103(a) which forms the basis for all obviousness rejections set forth in this Office action:

(a) A patent may not be obtained though the invention is not identically disclosed or described as set forth in section 102 of this title, if the differences between the subject matter sought to be patented and the prior art are such that the subject matter as a whole would have been obvious at the time the invention was made to a person having ordinary skill in the art to which said subject matter pertains. Patentability shall not be negated by the manner in which the invention was made.

6. Claims 2, 4 and 6 are rejected under 35 U.S.C. 103(a) as being unpatentable over Faroudja (US Patent No. 5,428,398) in view of Zhu et al. (US Patent No. 6,069,664).

In considering claim 2, Faroudja discloses all the limitations of the instant invention as discussed in claim 1 above, except for providing the claimed further comprising means for restoring a direct current level for the smooth interpolated video signal. Zhu et al teach that the PTI converter 10 and ITP converter 20 provide the

restoration of the full vertical resolution corresponding to a progressive video signal from a conventional interlaced video source produced by any progressive film scanner or other similar device where at least one of the horizontal scan lines have been repeated or replaced with a constant value (Fig. 1, col. 8, lines 20-56). Therefore, it would have been obvious to one ordinary skill in the art at the time of the invention to incorporate the restoration of the full vertical resolution as taught by Zhu et al into Faroudja's system in order to preserve the vertical resolution of a progressive film scan system and maintains (NTSC) interlaced video signal output for backward compatibility with existing recording equipment and standard video interfaces in the broadcasting and consumer electronics industry.

Claim 4 is rejected for the same reason as discussed in claim 2.

Claim 6 is rejected for the same reason as discussed in claim 2.
